At first i did not expect automation of server could be so easy it would think that this time it would be hard as i learn more there are many ways in automation and it makes the process much more easier with single config even if there is many automation process inside you can pin point in what you need to update upgrade or install in the machines. There are also choices in what computer is what you need to do the upgrade to as you can choose in which are the only ones who can get the update

Additionally server management the same as cloud you can transfer it to the web as such for github that you can upload your configuration inside the machine as there is no need for manual copy paste and security features are also good as you will use the ssh key that you used for the other servers.

Lastly the automation and deployment of static web app that you can use in real life for businesses that needs to access databases locally.
